## METAL FABRICATION®

Ci Metal Fabrication was recently awarded a large project to replace all of the ductwork on one old existing package boiler unit. With more than 45 years of experience successfully fabricating ductwork for the Original Equipment Manufacturer (OEM), Ci Metal Fabrication was able to successfully complete the project by replacing the ductwork on time and on budget.

This particular boiler unit and ductwork were originally installed back in the 1970's and over time had corroded away to the point of being inoperable. Rather than incurring the cost of an entire new boiler unit and ductwork, the OEM decided to enlist the services of Ci Metal Fabrication to stay on budget and save valuable resources. Ci Metal Fabrication was contracted to build all new ductwork components for the old package boiler with plans that fit the original design and incorporated a few modern modifications.

The updates requested by the OEM included upgrading some of the ductwork from the original carbon steel specification to A588 construction, a specification that covers high-strength and durable steel, to add additional life to the severely corrosive areas of the duct system. The updated ductwork will now last much longer than it had with the original construction.

Ci Metal Fabrication's consistency in quality, competitive pricing and on-time delivery has resulted in earned trust and consistently winning these contracts for the same end user. Ci Metal Fabrication is confident that the OEM will contact the custom metal fabricator in the future to upgrade the remaining units. This is just one example of many ductwork projects Ci Metal Fabrication has constructed for the OEM in nearly half of a decade of service.
